JOB MARKET PAPER

More Women, Narrower Gaps: Gender Norms and Wages Within Occupations

This paper examines how managers' and workers' gender-role attitudes shape gender wage inequality. I document smaller wage gaps between women and men with similar observable characteristics in occupations with higher female employment shares. Workers in these occupations, including men, hold more progressive gender-role attitudes. To explain these patterns, I develop a structural equilibrium model of dynamic occupational choice and firm wage setting. Workers' attitudes shape participation, sorting, and human capital accumulation, while managers' attitudes influence wages through their expectations of women's productivity. Managerial attitudes are central to explaining occupational wage-gap variation, while workers' attitudes affect female employment and aggregate production.
